

INTRODUCTION

Ernesto Sanchez ernesto.sanchez@polito.it

CAD GROUP www.cad.polito.it

Outline

- MIPS64: Introduction
- Assembler programs: How to Write
- WinMIPS64 the initial glance.

MIPS64

Generalities

- MIPS (Microprocessor without Interlocked Pipeline Stages) is a family of RISC processors, which have been very successful for embedded applications
- The first processor in the family was introduced in 1985
- Several versions have been introduced since then.

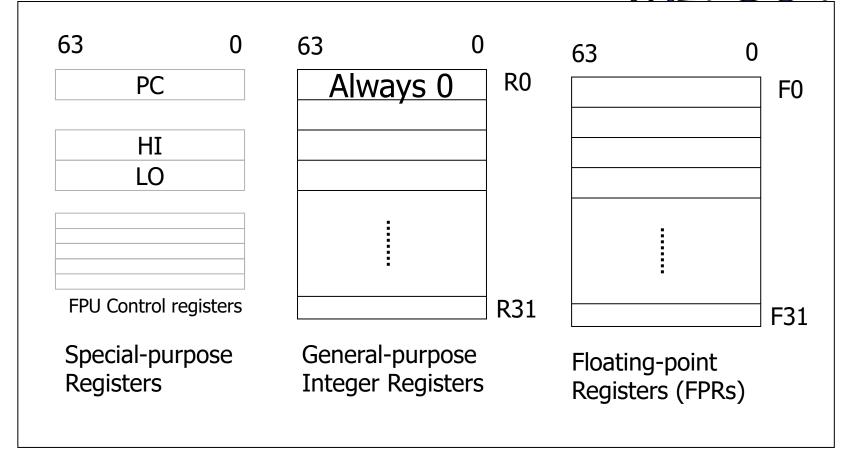

MIPS64

- Generalities
 - Simple load-store Instruction Set
 - Designed for pipeline efficiency
 - Fixed instruction length
 - Low-power applications
 - What is described here is a simplified version of the so called MIPS64.

MIPS64 – Programmer's Model

MIPS64

Data Types

- Byte (8 bits)
- Half Words (16 bits)
- Words (32 bits)
- Double Words (64 bits)
- 32-bit single precision floating-point
- 64-bit double precision floating-point.

Addressing Modes

It uses 16 bits Immediate field

DADDUI R1, R2, 32

$$R1 \leftarrow R2 + 32$$

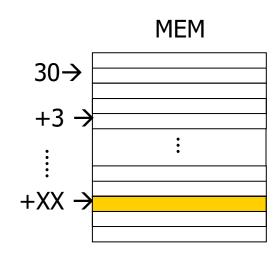

DADDUI R1, R0, 32

Addressing Modes

- Displacement
 - LD R1, 30(R2)

$$R2 = XX$$

$$R1 \leftarrow MEM[30 + R2]$$

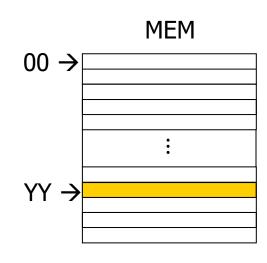

Addressing Modes

- Displacement
 - LD R1, $0(R2) \rightarrow Register Indirect$

$$R2 = YY$$

 $R1 \leftarrow MEM[R2]$

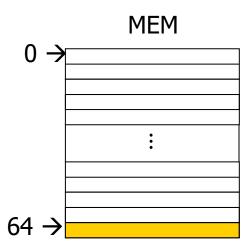

4

Addressing Modes

- Displacement
 - LD R1, $64(R0) \rightarrow Absolute Addressing$

 $R1 \leftarrow MEM[64]$

Instruction Format

- A CPU instruction is a single 32-bit aligned word
 - Include a 6-bit primary opcode

- The CPU instruction formats are:
 - Immediate
 - Register
 - Jump.

Instruction Format – Immediate

■ I – type instruction

6 5 5 16

OPcode Rs Rt Immediate

Field	Description	
opcode	6-bit primary operation code	
Rs	5-bit specifier for the source register	
Rt	5-bit specifier for the target (source/destination) register	
Immediate	16-bit signed <i>immediate</i> used for logical operands, arithmetic signed operands, load/store address byte offsets, and PC-relative branch signed instruction displacement	

Instruction Format – Register

■ R – type instruction

6 5 5 5 5 6

OPcode Rs Rt Rd Sa Function

Field	Description	
opcode	6-bit primary operation code	
Rd	5-bit specifier for the destination register	
Rs	5-bit specifier for the source register	
Rt	5-bit specifier for the target (source/destination) register	
Sa	5-bit shift amount	
Function	6-bit function field used to specify functions within the primary opcode SPECIAL	

Instruction Format – Jump

J – type instruction

6 26

OPcode Offset added to PC

Field	Description	
opcode	6-bit primary operation code	
Offset	26-bit index shifted left two bits to supply the low-order 28 bits of the jump target address	

INSTRUCTION SET

- Grouped By Function
 - Load and store
 - ALU operations
 - Branches and Jumps
 - Floating Point
 - Miscellaneous

Each instruction is 32 bits long.

- MIPS processors use a load/store architecture
- Main memory is accessed only through load and store instructions.

4

Load and Store – Examples

LD load double word

```
LD R1, 28 (R8) ; R1 \leftarrow MEM[28 + R8]
```

LB load Byte

```
LB R1, 28(R8); R1 \leftarrow ([MEM[28 + R8]]<sub>7</sub>)<sup>56</sup> ## MEM[28 + R8]
```

LBU load Byte unsigned

```
LBU R1, 28 (R8) ;R1 \leftarrow 0<sup>56</sup> ## MEM[28 + R8]
```

Load and Store – Examples

L.S load FP Single

```
L.S F4, 46(R5) ; F4 \leftarrow MEM[46 + R5] ## 0<sup>32</sup>
```

L.D load FP Double

```
L.D F4, 46(R5); F4 \leftarrow MEM[46 + R5]
```

SD Store Double

```
SD R1, 28(R8) ; MEM[28 + R8] \leftarrow R1
```

Load and Store – Examples

SW Store Word

SW R1, 28(R8)

; MEM [28 + R8] \leftarrow_{32} R1 LSB

SH

Store Half Word

SH R1, 28(R8)

; MEM [28 + R8] \leftarrow_{16} R1 LSB

SB

Store byte

SB R1, 28 (R8) ; MEM[28 + R8] \leftarrow_{8} R1 LSB

Load and Store – Examples

S.S Store FP Single

S.S F4, 28(R8)

; MEM[28 + R8] \leftarrow_{32} F4_{63..32}

S.D

Store FP Double

S.D F4, 28(R8)

;MEM[28 + R8] ← F4

ALU operations

- All operations are performed on operands held in processor registers
- Instruction types
 - Immediate and three-operand Instructions
 - Two-operand Instructions
 - Shift instructions
 - Multiply and divide instructions
- 2's complement arithmetic
 - Add
 - Subtract
 - Multiply
 - Divide.

ALU operations: R0 usage

- ADD immediate with R0 as source operand
 - loading a constant

```
DADDUI R1,R0,25 ;R1 ← 25
```

- ADD Rx with R0 as source operand
 - register to register.

```
DADD R1,R0,R2 ;R1 \leftarrow R2
```

ALU – Examples

DADDU

Double Add unsigned

```
DADDU R1, R2, R3 ; R1 ← R2 + R3
```

DADDUI Double Add Unsigned Immediate

```
DADDUI R1,R2,74 ;R1 ← R2 + 74
```

LUI Load Upper Immediate

```
LUI R1,0x47 ;R1 \leftarrow 0<sup>63..32</sup> ## 0x47 ## 0<sup>15..0</sup>
DADDUI R1,R1,0x13 ;R1 \leftarrow R1 + 0x13
;R1 \leftarrow 0x470013
```

```
LUI + ORI:
; +2,147,483,647 -> 0x7FFF_FFF
lui r7, 0x7FFF ; r7 = 0000_ 0000_7FFF_ 0000
ori r7, r7, 0xFFFF ;
```

```
; From now
;r7 = 0000_ 0000_7FFF_ FFFF
```

0000_ 0000_7FFF_0000 0000_ 0000_0000_FFFF

0000_ 0000_7FFF_ FFFF

NOTE: ALL Logical instructions extend the immediate with

0

Α	В	A or B
0	0	0
0	1	1
1	0	1
1	1	1

How to obtain:

NOTE: 0xC = 0b1100

 $r7 = 0000 _ 0000 _ C1A0_FEDE$

LUI + ORI:

FFFF_FFFF_C1A0_FEDE

Shift Left Logical 32 bits:

C1A0_FEDE_0000_0000

Shift Right Logical 32 bits:

0000 _ 0000 _C1A0_FEDE

ALU – Examples

DSLL Double Shift left logical

```
DSLL R1, R2, 3 ;R1 ← R2 <<3
```

SLT Set Less than

```
SLT R1,R2,R3 ; IF (R2 < R3) R1 \leftarrow 1 ; ELSE R1 \leftarrow 0
```

- PC-relative conditional branch
- Absolute (register) unconditional jump
- A set of procedure calls that record a return link address in a general register.

Branch and Jump – Examples

J Unconditional Jump

```
J name ; PC ← name

JAL Jump and Link

JAL name ; R31 ← PC+4; PC ← name

JALR Jump and Link Register

JALR R4 ; R31 ← PC+4; PC ← R4
```

Branch and Jump – Examples

JR Jump Register

JR R3 ; $PC \leftarrow R3$

BEQZ Branch Equal Zero

BEQZ R4, name ; IF (R4 = 0) then PC \leftarrow name

BNE Branch Not Equal

BNE R3, R4, name ; IF (R3 != R4) then PC \leftarrow name

Miscellaneous

MOVZ Conditional Move if Zero

```
MOVZ R1, R2, R3; IF (R3 = 0) then R1 \leftarrow R2
```

NOP No Operation

```
NOP ; It means SLL RO, RO, 0
```

Floating Point

- The FPU instructions include almost the same instructions types:
 - Data Transfer Instructions
 - Arithmetic Instructions
 - Conditional Branch Instructions
 - Miscellaneous Instructions-

                                 next loop
                  qool
                                 ; *** write result to tdout
                  Print,f2
EndL:
       sd
        addi
                  r14,r0,Print
                                 :*** end
        trap
```

- Assembler Directives
- Labels
- Mnemonics
- Operands
- Comments

WinMIPS64 the initial Glance

- Instruction set simulator
- 64-bit MIPS architecture
- Architectural features
 - Forwarding
 - Delay slot
 - Branch prediction.

WinMIPS64 the initial Glance

Assembler Directives:

- datastart of data segment
- text start of code segment
- code start of code segment (same as .text)
- .org <n> start address
- space <n> leave n empty bytes
- asciiz <s> enters zero terminated ascii string
- ascii <s> enter ascii string
- align <n> align to n-byte boundary ...

WinMIPS64 the initial Glance

Assembler Directives:

- .word <n1>,<n2>.. enter word(s) of data (64-bits)
- .byte <n1>,<n2>.. enter bytes
- .word32 <n1>,<n2>.. enter 32 bit number(s)
- .word16 <n1>,<n2>.. enter 16 bit number(s)
- .double <n1>,<n2>.. enter floating-point number(s)
- where <n> denotes a number like 24, <s> denotes a string like "fred"
- <n1>,<n2>... denotes numbers seperated by commas.

Load and store

- Ib load byte
- Ibu load byte unsigned
- sb store byte
- Ih load 16-bit half-word
- Ihu load 16-bit half word unsigned
- sh store 16-bit half-word
- lw load 32-bit word
- lwu load 32-bit word unsigned
- sw store 32-bit word
- Id load 64-bit double-word
- sd store 64-bit double-word
- I.d load 64-bit floating-point
- s.d store 64-bit floating-point

ALU operations

- daddi add immediate
- daddui add immediate unsigned
- andi logical and immediate
- ori logical or immediate
- xori exclusive or immediate
- lui load upper half of register immediate

Branches and Jumps

- j jump to address
- jr jump to address in register
- jal jump and link to address (call subroutine)
- jalr jump and link to address in register (call subroutine)
- beq branch if pair of registers are equal
- bne branch if pair of registers are not equal
- beqz branch if register is equal to zero
- bnez branch if register is not equal to zero

Floating Point

- add.d add floating-point
- sub.d subtract floating-point
- mul.d multiply floating-point
- div.d divide floating-point
- mov.d move floating-point

Miscellaneous

- movz move if register equals zero
- movn move if register not equal to zero
- nop no operation

4

A naïve example

C = A + B

```
.data
```

Val_A: .word 10
Val B: .word 20

Val C: .word 0

.text

Main:

ld R1, Val_A(R0)
ld R2, Val_B(R0)
dadd R3, R2, R1
sd R3, Val C(R0)

.data

Val_A: dw 10

Val B: dw 20

Val C: dw 0

•••

Main:

mov AX, Val_A add AX, Val_B mov Val_C, AX

MIPS PROGRAM

A naïve example (1)

C = A + B

```
.data
```

Val_A: .word 10
Val_B: .word 20
Val_C: .word 0

.text

Main:

ld R1, Val_A(R0)
ld R2, Val_B(R0)
dadd R3, R2, R1
sd R3, Val C(R0)

Code Analysis	
# instructions	4
Code size [bytes]	16
Execution time [C.C.]	4

4

A naïve example (2)

C = A + B

Code Analysis		
# Instructions	3	
Code size [bytes]	8	
Execution time [C.C.]	33	

.data

Val_A: dw 10 Val_B: dw 20 Val C: dw 0

•••

Main:

mov AX, Val_A
add AX, Val_B
mov Val_C, AX

A 2nd example

```
/* Sum of 10 integer values */
#include <stdio.h>

const long int values[10] = {1, 2, 3, 4, 5, 6, 7, 8, 9, 10};
int main() {
        long int result;

        result = 0;
        for (int i = 0; i < 10; i++) {

            result = result + values[i];
        }
}</pre>
```

A 2nd example

```
.data
     ; const long int values[10] = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\};
     values: .word 1, 2, 3, 4, 5, 6, 7, 8, 9, 10;64-bit integers
     ;long int result;
     result: .space 8
; CODE SECTION
.text
MATN:
  ; result = 0; i = 0;
 daddui R1,R0,10 ;R1 ← 10 COUNTER REG
 dadd R2,R0,R0 ;R2 \leftarrow 0 POINTER REG
 dadd R3,R0,R0 ;R3 \leftarrow 0 RESULT REG
LOOP:
  ; result = result + values[i];
        R4, values (R2) ;GET A VALUE IN R4
  ld
 dadd R3,R3,R4;R3 \leftarrow R3 + R4
  ; i < 10; i++
 daddi
        R2,R2,8 ;R2 ← R2 + 8 POINTER INCREMENT
 daddi R1,R1,-1 ;R1 ← R1 - 1 DECREMENT COUNTER
        R1,LOOP
 bnez
         R3, result (R0); Result in R3
  sd
         ; the end
  HALT
```

; DATA SECTION

```
int main(){
    long int result;
    result = 0;
    for (int i = 0; i < 10; i++) {
        result = result + values[i];
```

- WinMIPS64, Mike Scott http://indigo.ie/~mscott/

Friendly Suggestions

- Start playing with WinMIPS64, practicing in translating C constructs in the assembly equivalent: if-else, for loop, while loop, do while, switch case, etc...
- For any assembly program: first write the C version, then translate it in assembly (optimization later....)
- Golden Rule: KISS

Keep It Simple and Straightforward
